

# FLUIDFILLER TROUBLE SHOOTING TIPS

The FLUIDFILLER is designed to last for years if used per our recommendations. However, after a few years things may break down or get loose.

1. If the Zinc plating is wearing off in the areas of friction and rust appears, simply de-assemble the unit and paint it with Rustoleum spray paint. Two coats will do.
2. If it gets shaky and loose, tighten the nylon lock nuts a couple turns. Make sure the inside handle slides with no effort.
3. If the bottle wears out or is lost, the replacement size is “8oz cylindrical 2” diameter plastic bottle”
4. If it gets bent, bend it back!

We also have a “repair kit” that has all the necessary hardware and bottle to rebuild your FluidFiller. The link is on the front page of the website.
